

Experiment 8: Create and Manage a Graph Database

Student Name(s):	Priyanka	Experiment Date:	2026-09-21
Roll No(s):	40		
Quiz Evaluation:	5 / 10 (50%)		

1. Aim & Expected Outcome

Aim: Create nodes and relationships, and perform basic graph operations.
Expected outcome: A functioning graph database containing connected entities.

2. Learning Objectives

- Understand what a graph database is and how it differs from a relational database.
- Learn the building blocks of a property graph: nodes, labels, relationships and properties.
- Create, read, update and delete (CRUD) nodes and relationships.
- Query the graph for neighbors and shortest paths between entities.
- Visualize the resulting graph and record observations in a lab report.

3. Final Graph State

Nodes: 5 Relationships: 2

- Supriya -[FRIENDS_WITH]-> Amogh
- Amogh -[FRIENDS_WITH]-> Akshit

4. Observations & Analysis

The experiment demonstrated the creation and management of a graph database of connected entities, matching the expected outcome.
